

## ABSTRACT

The present invention concerns a process for the acceptance of coins as well as a device for the execution of the process.

It is the task of the objective of the present invention to refine a representative process and a device in such a way that a customer-friendly simplification is achieved while maintaining high level of security.

A process for the acceptance of coins in automatic payment transactions is proposed where the coins are fed to at least one pair of rollers rotating in the same direction for the separation of coins.
